## Q 1A:

## I. Law of Definite Proportions

A given compound always contains exactly the same proportion of elements by weight.

## II. Law of Multiple Proportions

if two elements can combine to form more than one compound, the masses of one element that combine with a fixed mass of the other element, are in the ratio of small whole numbers.

Q 1B

| I. Mass of One atom of Sodium=? | ii. Mass of One Molecule of Ozone=? |
| :---: | :---: |
| Solution:- $6.022 \times 10^{23}$ atoms of Sodium $=23 \mathrm{gms}$ One atom of Sodium $=\mathrm{X} \mathrm{gm}$ $\mathrm{X}=23 /\left(6.022 \times 10^{2 s}\right)$ <br> One atom of Na will weigh $=3.819 \times 10^{-23} \mathrm{gms}$ | Molecular mass of Ozone $=\mathrm{O}_{3}=(3 \times 16)=48$ |
|  | $6.022 \times 10^{23}$ Molecule of Ozone $=48 \mathrm{gms}$ |
|  | One Molecule of Ozone=x gm |
|  | $\mathrm{X}=48 /\left(6.022 \times 10^{23}\right)$ |
|  | Mass of One Molecule of Ozone $=7.97 \times 10^{-23} \mathrm{gms}$ |

Q 1C Flow sheet diagram showing Classification of Matter

Q2A

| Element | symbol | \% | At mass | Relative No of moles | Simple Ratio | 皆 | $\begin{aligned} & \frac{0}{0} \\ & \frac{1}{3} \end{aligned}$ | $\stackrel{\text { O }}{\substack{+0 \\ \sim \\ \sim}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Silver | Ag | 70.6 | 108 | $\frac{70.6}{108}=0.6537$ | $\frac{0.6537}{0.3047}=2.14$ |  | 2 |  |
| Sulphur | S | 9.75 | 32 | $\frac{9.75}{32}=0.3047$ | $\frac{0.3047}{0.3047}=1$ |  | 1 |  |
| Oxygen | 0 | 19.6 | 16 | $\frac{19.6}{16}=1.225$ | $\frac{1.225}{0.3047}=4.02$ |  | 4 |  |
| Empirical formula $=\mathrm{Ag}_{2} \mathrm{SO}_{4}$ |  |  |  |  |  |  |  |  |

I. The electron in the hydrogen atom can move around the nucleus in a circular path of fixed radius and energy. These paths are called orbits, stationary states or allowed energy states. These orbits are arranged concentrically around the nucleus.
II. The energy of an electron in the orbit does not change with time. However, the electron will move from a lower stationary state to a higher stationary state when required amount of energy is absorbed by the electron or energy is emitted when electron moves from higher stationary state to lower stationary state. The energy change does not take place in a continuous manner.
III. The frequency of radiation absorbed or emitted when transition occurs between two stationary
states that differ in energy by $\Delta \mathrm{E}$, is given by

$$
v=\frac{\Delta E}{h}=\frac{E_{2}-E_{1}}{h}
$$

Where $E_{1}$ and $E_{2}$ are the energies of the lower and higher allowed energy states respectively. This expression is commonly known as Bohr's frequency rule.
IV. The angular momentum of an electron in a given stationary state can be expressed as in equation

$$
m_{0} v r=n \cdot \frac{h}{2 \pi} \quad n=1,2,3 \ldots
$$

Thus an electron can move only in those orbits for which its angular momentum is integral multiple of $h / 2 \pi$ that is why only certain fixed orbits are allowed

Q 2C In a chemical Reaction the reactant which is present in the lesser amount gets consumed after sometime and after that no further reaction takes place whatever be the amount of the other reactant present. Hence, the reactant which gets consumed, limits the amount of product formed and is, therefore, called the limiting reagent.

## Q 3A

A. Ruther ford's scattering experiment

B. Schematic molecular view of the gold foil

## Observations made by Rutherford based on his scattering experiment

(i) most of the $\alpha$-particles passed through the gold foil undeflected.
(ii) a small fraction of the $\alpha$-particles was deflected by small angles.
(iii) a very few $\alpha$ - particles ( $\sim 1$ in 20,000) bounced back, that is, were deflected by nearly $180^{\circ}$
Q 3B
$\mathrm{Ca}=20$
E.C= $\quad 1 s^{2} 2 s^{2} 2 p^{6} 3 s^{2} 3 p^{6} 4 s^{2}$
Or $[\mathrm{Ar}] 4 \mathrm{~s}^{2}$

N shell $=4 \mathrm{~s}^{2}$ Quantum No for both these electrons are as follows

$$
\begin{aligned}
& \mathrm{n}=4, \mathrm{l}=0, \mathrm{~m}_{\mathrm{l}}^{\mathrm{l}}=0, \mathrm{~m}_{\mathrm{S}}=+1 / 2 \\
& \mathrm{n}=4, \mathrm{l}=0, \mathrm{~m}_{\mathrm{l}}=0, \mathrm{~m}_{\mathrm{S}}=-1 / 2
\end{aligned}
$$

## Q 3C

Properties of Cathode rays (any Two)
I. The cathode rays start from cathode and move towards the anode.
II. These rays themselves are not visible but their behaviour can be observed with the help of certain kind of materials (fluorescent or phosphores )
III. In the absence of electrical or magnetic field, these rays travel in straight lines
IV. In the presence of electrical or magnetic field, the behaviour of cathode rays are similar to that expected from negatively charged particles, suggesting that the cathode rays consist of negatively charged particles, called electrons.
V. The characteristics of cathode rays (electrons) do not depend upon the material of electrodes and the nature of the gas present in the cathode ray tube.

## Q4A 3d \& 2s

Q 4B In a Sixth period the Orbital's available for filling the electrons are $\mathbf{6 s} \mathbf{4 f} \mathbf{5 d}$ and $\mathbf{6 p}$ The order in which the energy of the available orbital's $6 s \mathbf{4 f} 5 \mathrm{~d} 6 \mathrm{p}$ increases as $6 s<4 f<5 \mathrm{~d}<6 \mathrm{p}$. The total number of orbitals available is $(1+7+5+3)=16$. The maximum number of electrons that can be accommodated is 32; and therefore 32 elements are there in the $6^{\text {th }}$ period.

## Q4C

## I. Modern Periodic Law

The physical and chemical properties of the elements are periodic functions of their atomic numbers.

## II. Ununoctium

OR
II. In the Second Period First element= Lithium \& Last element=Neon
